

LISTE DES PLANS D'EAU TOUCHÉS PAR UNE FLEUR D'EAU D'ALGUES BLEU-VERT DE 2004 À 2017 ET DES PLANS D'EAU RÉCURRENTS SIGNALÉS DE 2013 à 2015.

Le ministère de l'Environnement et de la Lutte contre les changements climatiques (MELCC) et le ministère de la Santé et des Services sociaux (MSSS) ont retenu la densité d'au moins 20 000 cellules d'algues bleu-vert par millilitre pour déterminer si un plan d'eau était touché par une telle fleur d'eau. Ces plans d'eau figurent sur la liste fournie plus bas. Les municipalités citées sont riveraines d'un plan d'eau touché et ont été avisées de la problématique.

Dans le cadre du plan de gestion des épisodes de fleurs d'eau de cyanobactéries, le gouvernement a ajusté ses niveaux d'intervention en 2008, 2013, 2014, 2016 et 2018. De 2013 à 2015, le MELCC visitait seulement les plans d'eau signalés non récurrents (moins de trois années sur six) ou qualifiés de sensibles (ex. : premier signalement, entente transfrontalière ou source d'approvisionnement en eau potable). Ainsi, les plans d'eau récurrents (touchés trois années et plus sur six) signalés n'ont pas été visités, la problématique y étant déjà connue. Ces derniers sont identifiés de 2013 à 2015 au moyen d'une étoile (*) dans le tableau. En 2016 et 2017, seuls les plans d'eau signalés et qualifiés de sensibles (situation majeure, cas de santé publique, entente transfrontalière ou source d'approvisionnement en eau potable) ont fait l'objet de visites, le cas échéant.
